Docket No.: 1190-0601PUS1

## AMENDMENTS TO THE CLAIMS

The claims have been amended as follows:

1. (Withdrawn) A disk device comprising:

a traverse unit including a turn table that holds and rotates a disk medium, an optical pickup that performs at least one of writing and reading of information on said disk

medium, and a traverse chassis that supports them:

a carrying means that carries said disk medium between a loading position and an

unloading position; and

a main chassis supporting said traverse unit so that said traverse unit is capable of

rotating, allowing said traverse unit to move toward and away from said disk media,

wherein said traverse chassis has a pair of coaxial rotation shafts for said rotating.

and said main chassis has a pair of supporting portions respectively supporting said rotation

shafts, and

wherein said rotation shafts have abutting portions capable of abutting against

said pair of supporting portions so as to prevent said supporting portions from being deformed in

directions away from each other.

2. (Withdrawn) The disk device according to claim 1, wherein said abutting portions

are constructed of protrusions formed on outer surfaces of said rotation shafts.

3. (Withdrawn) The disk device according to claim 1, wherein said supporting

portions include groove portions that open in a direction substantially perpendicular to the

carrying direction of said disk medium carried by said carrying means, and resiliently deformable position-regulating members that regulate the positions of said rotation shafts so as

to prevent said rotation shafts from being dropped out of said groove portions.

Application No. 10/526,401 Docket No.: 1190-0601PUS1 Amendment dated October 24, 2007

Reply to Office Action of July 26, 2007

4. (Currently Amended) A disk device comprising:

a traverse unit including a turn table that holds and rotates a disk medium, an

optical pickup that performs at least one of writing and reading of information on said disk

medium, and a traverse chassis that supports them;

a carrying means that carries said disk medium between a loading position and an

unloading position; and

a main chassis supporting said traverse unit so that said traverse unit is capable of

rotating, allowing said traverse unit to move toward and away from said disk media,

wherein said traverse chassis has a pair of coaxial rotation shafts for said rotating,

and said main chassis has a pair of supporting portions respectively supporting said rotation

shafts, and

wherein said supporting portions are so constructed that said rotation shafts are

inserted into said supporting portions in a direction substantially parallel to the carrying direction

of said disk medium carried by said carrying means, wherein said supporting portions include

groove portions that open in a direction substantially parallel to the carrying direction of said

disk medium carried by said carrying means.

5. (Currently Amended) The disk device according to claim 4, wherein said

supporting portions include groove portions that open in a direction substantially parallel to the

earrying direction of said disk medium carried by said earrying means, and resiliently deformable position-regulating members that regulate the positions of said rotation shafts so as

to prevent said rotation shafts from being dropped out of said groove portions.

6. (Original) The disk device according to claim 5, wherein said position-regulating

members are elongated members elongated in the direction substantially parallel to the carrying

direction of said disk medium carried by said carrying means.

Application No. 10/526,401 Docket No.: 1190-0601PUS1 Amendment dated October 24, 2007

Reply to Office Action of July 26, 2007

 (Original) The disk device according to claim 4, wherein said rotation shafts have abutting portions that abut against said supporting portions so as to prevent said pair of

supporting portions from being deformed in the directions away from each other.

8. (Withdrawn) The disk device according to claim 7, wherein said abutting portion

includes two or more protrusions respectively protruding in different directions.

9. (New) A disk device comprising:

a traverse unit including a turn table that holds and rotates a disk medium, an

optical pickup that performs at least one of writing and reading of information on said disk

medium, and a traverse chassis that supports them;

a carrying means that carries said disk medium between a loading position and an

unloading position; and

a main chassis supporting said traverse unit so that said traverse unit is capable of

rotating, allowing said traverse unit to move toward and away from said disk media,

wherein said traverse chassis has a pair of coaxial rotation shafts for said rotating, and said main chassis has a pair of supporting portions respectively supporting said rotation

shafts, and

portions.

wherein said supporting portions include groove portions that open in a direction

substantially parallel to the carrying direction of said disk medium carried by said carrying

means, and resiliently deformable position-regulating members that regulate the positions of said

rotation shafts so as to prevent said rotation shafts from being dropped out of said groove

10. (New) The disk device according to claim 9, wherein said position-regulating

members are elongated members elongated in the direction substantially parallel to the carrying

5

direction of said disk medium carried by said carrying means,

Application No. 10/526,401 Amendment dated October 24, 2007

Reply to Office Action of July 26, 2007

(New) The disk device according to claim 9, wherein said rotation shafts have 11. abutting portions that abut against said supporting portions so as to prevent said pair of

supporting portions from being deformed in the directions away from each other.

(New) The disk device according to claim 11, wherein said abutting portion 12.

includes two or more protrusions respectively protruding in different directions.

13. (New) The disk device according to claim 12, wherein said protrusions are

formed on the tip portion of said rotation shafts
